Base e and the Natural Log

$$e = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n$$

n	e
1	2
10	2.5937
100	2.7048
1000	2.71692
10,000	2.71814
1,000,000	2.71828

$e \approx 2.71828$

$$\log_e x = \ln x$$

"The natural log of x"

Exponential Form	Logarithmic Form
$e^{2.64} = 14$	$\ln 14 = 2.64$
$e^{3.09} = 22$	$\ln 22 = 3.09$
$e^{-1.1} = 1/3$	$\ln \frac{1}{3} = -1.1$
$e^{1/5} = 1.22$	$\ln 1.22 = 1/5$
$e^4 = 54.6$	$\ln 54.6 = 4$

Simplify: $\log_{10} 10^2$

$$\ln e^4 = 4$$

$$\ln e^2 = 2$$

$$\ln \frac{1}{e^3} = -3$$

$\ln e^{-3}$

Simplify:

$$\ln 1 = 0$$

$$\ln \sqrt{e} = \frac{1}{2}$$

$$\ln e = 1$$

Simplify:

$$e^{\ln 17} = 17$$

$$e^{\ln 21} = 21$$

$$\ln e^{4x+3} = 4x+3$$

Solve

$$\ln 3x = 2$$

$$\begin{aligned} e^2 &= 3x \\ \frac{e^2}{3} &= x \\ 2.4630 &= x \end{aligned}$$

Solve

$$\ln (x-5) = 4$$

$$\begin{aligned} e^4 &= x - 5 \\ 59.5982 &= x \end{aligned}$$

Solve

$$\ln 2x + \ln x = \ln 8$$

$$\begin{aligned} \ln 2x^2 &= \ln 8 \\ (2) \quad 2x^2 &= 8 \\ x^2 &= 4 \\ x &= \pm 2 \end{aligned}$$

Solve

$$\begin{aligned} e^{4x} &= 24 \\ \frac{\ln 24}{4} &= \frac{4x}{4} \\ .7945 &\approx x \end{aligned} \left\{ \begin{aligned} e^{4x} &= 24 \\ \ln e^{4x} &= \ln 24 \\ 4x &= \ln 24 \\ x &= \frac{\ln 24}{4} \end{aligned} \right.$$

If interest is compounded continuously, use the formula:

$$A = Pe^{rt}$$

A = amount
P = principal (amount start w/)
r = rate
t = time

$$A = Pe^{rt}$$

If \$1,000 is compounded continuously at 6% interest:

- How much money would there be in one year?
- How much money would there be in 8 years?

$$A = 1000e^{.06(1)}$$

\$1061.84

$$A = 1000e^{(.06 \cdot 8)}$$

\$1616.07

How long would it take that same principal to reach at least \$1350.

$$A = Pe^{rt}$$

$$1350 = 1000e^{.06t}$$

$$1.35 = e^{.06t}$$

$$\ln 1.35 = \ln e^{.06t}$$

$$\ln 1.35 = .06t$$

$$5 \text{ yrs} = t$$

More About . . .

Money

To determine the doubling time on an account paying an interest rate r that is compounded annually, investors use the "Rule of 72." Thus, the amount of time needed for the money in an account paying 6% interest compounded annually to double is $\frac{72}{6}$ or 12 years.

Evaluate each expression.

34. $e^{\ln 0.2}$

35. $e^{\ln y}$

36. $\ln e^{-4x}$

37. $\ln e^{45}$

Solve each equation or inequality.

38. $3e^x + 1 = 5$

39. $2e^x - 1 = 0$

40. $e^x < 4.5$

41. $e^x > 1.6$

42. $-3e^{4x} + 11 = 2$

43. $8 + 3e^{2x} = 26$

44. $e^{5x} \geq 25$

45. $e^{-2x} \leq 7$

46. $\ln 2x = 4$

47. $\ln 3x = 5$

48. $\ln(x+1) = 1$

49. $\ln(x-7) = 2$

50. $\ln x + \ln 3x = 12$

51. $\ln 4x + \ln x = 9$

52. $\ln(x^2 + 12) = \ln x + \ln 8$

53. $\ln x + \ln(x+4) = \ln 5$

MONEY For Exercises 54–57, use the formula for continuously compounded interest found in Example 6.

54. If you deposit \$100 in an account paying 3.5% interest compounded continuously, how long will it take for your money to double?

55. Suppose you deposit A dollars in an account paying an interest rate r as a percent, compounded continuously. Write an equation giving the time t needed for your money to double, or the *doubling time*.

56. Explain why the equation you found in Exercise 55 might be referred to as the "Rule of 70."
